## 101 methods of design pdf free online pdf reader

There are several different types of insulin: Long-acting insulins deliver a constant dose of insulin for an extended period of time (typically 20 to 24 hours). Keep an eye on your feet, and address any sores or blisters right away. You can manage Type 2 diabetes with a combination of medicines and lifestyle changes. These may also happen if you have diabetes that's undiagnosed, or if you don't get treatment for your diabetes. Learn about the types and how they're different. Kidney Damage Diabetes can damage the blood vessels inside your kidneys, causing kidney disease. If you're diagnosed with diabetes, your doctor will work with you to make a personalized treatment plan. High blood pressure can also cause kidney damage, so it's important to keep your blood pressure within the normal range. High blood sugar levels can damage the tiny blood vessels in your eyes. The good news is that you can take steps to prevent diabetes. With Type 2 diabetes, your fat, liver, muscle and other cells begin to ignore insulin signals, even when there's plenty of insulin in your bloodstream. If you have problems with your feet, you may need to see a diabetes foot specialist, called a diabetic podiatrist. Low blood sugar causes symptoms like weakness, trembling, palpitations, abdominal pain, nausea and vomiting. If you already have diabetes, you can prevent complications by controlling your blood sugar. Follow these steps: Stay at a healthy weight. Insulin Therapy The main treatment for people with Type 1 diabetes is insulin. Without treatment, high blood sugar from diabetes can damage your organs and other body systems. Without treatment and lifestyle changes to manage your blood sugar, diabetes can lead to serious complications. Type 1 Diabetes In Type 1 diabetes, your immune system destroys the cells in your pancreas that make insulin. They also help your body better respond to insulin and absorb the sugars you eat more effectively.Dipeptidyl peptidase-4 (DPP-4) inhibitors, such as Alogliptin and Saxagliptin, help your pancreas produce more insulin.Sulphonylureas, such as Gliclazide, stimulate your pancreas to produce more insulin.Thiazolidinediones, such as Pioglitazone, reduce insulin resistance in fat cells.Glucagon-like peptide-1 (GLP-1) receptor agonists, such as Exenatide and Liraglutide, improve insulin secretion from your pancreas.Sodium-glucose transporter (SGLT) 2 inhibitors help your kidneys get rid of excess glucose. Gestational Diabetes Gestational diabetes happens during pregnancy. Prediabetes Prediabetes develops when your blood sugar is higher than normal levels, but isn't high enough to be considered Type 2 diabetes yet. Causes and Risk for Type 1 Experts believe Type 1 diabetes is primarily genetic, but there's no single gene that can tell you your risk for diabetes. Experts aren't sure exactly how weight affects diabetes risk, but they think fat cells may play a role in insulin resistance.Physical activity level — Lack of exercise can raise your risk for Type 2 diabetes. Smoking — People who smoke are more likely to get Type 2 diabetes. What Are the Symptoms of Diabetes? The higher your A1C level is, the greater your risk is of developing complications of diabetes. Your risk also goes up as you get older. It leads to higher-than-normal blood glucose (sugar) levels. There's also live online events, interactive content, certification prep materials, and more. And at least 7 million of those people don't know they have it. A reading of 5.7% or less is considered normal for someone without diabetes. More than 1 in 3 Americans has prediabetes — but because it has no symptoms, most people don't know they have it. People with Type 2 diabetes sometimes also need insulin therapy. Symptoms of DKA (in addition to other diabetes symptoms) include: BreathlessnessExtreme fatigueAbdominal painNausea and vomitingConfusionLoss of consciousnessSeizures Your Next Steps for Living With Diabetes Managing diabetes takes time and effort — but the good news is that treatments and lifestyle changes can help you manage your blood sugar and avoid diabetes complications. Type 1 usually starts in childhood or teen years, while Type 2 usually starts in adulthood. Type 2 diabetes can also increase your risk of developing other health conditions, like high cholesterol or high blood pressure. Infections Diabetes raises your risk for infections — particularly skin infections. In Type 1 diabetes, your pancreas produces little or no insulin. Causes and Risk for Type 2 Like Type 1 diabetes, there's also not one exact cause of Type 2 diabetes. If you're already experiencing diabetes symptoms, your doctor may check for problems with your eyesight and sensation in your feet. It's important to talk with your doctor regularly about your insulin treatment plan. Am I at Risk? As a result, sugar builds up in your bloodstream. Symptoms often come on rapidly over a period of weeks or months. If you have heart attack symptoms like chest pain, get help right away. Kidney disease often has no symptoms until later stages. These symptoms include: Blurred visionSkin infectionsSlow healing of woundsNumbness or tingling of the hands or feetSexual problems like erectile dysfunction Warning signs of diabetes can be subtle. If you're overweight, talk with your doctor about healthy ways to manage your weight.Get more physical activity. For example, Type 1 diabetes is more common in certain parts of the world and in urban areas. Nerve damage usually affects your hands and feet first. Diabetic Ketoacidosis People with Type 1 diabetes develop a condition called diabetic ketoacidosis (DKA). That way, the doctor can see how your body processes the sugar. Getting the treatment you need can help prevent the most serious effects of diabetes. Your doctor may also recommend a low-sugar diet and suggest swapping simple and refined carbohydrates (like candy, pastries and white bread) for complex carbohydrates such as whole grains and legumes (like beans and lentils). When you've been fasting, your blood sugar should be between 70 mg/dl and 99 mg/dl (milligrams of sugar per deciliter of blood). They peak within 2 or 3 hours and continue working for between 12 and 16 hours. Rapid-acting insulins work within a few minutes. As part of the screening process, your doctor may ask you about any diabetes symptoms you have, your eating and exercise habits, and any family history of diabetes. Your doctor can also help you find resources to help you live with diabetes — like referring you to a diabetes educator or support groups for people with diabetes. In some cases, it can cause loss of consciousness, seizures and even death. There are several common treatments that are likely to play a role in the ways you manage life with diabetes. There's no way to prevent Type 1 diabetes — but you can take steps to prevent Type 2 diabetes by maintaining a healthy lifestyle. And if you notice changes in your vision, tell your doctor right away. You'll use a glucose monitor device to do this. However, there are several risk factors that can increase your risk for Type 2 diabetes, including: Family history — Genes play a role, so you're more likely get Type 2 diabetes if you have a parent or sibling with the condition.Weight — Obesity is the strongest risk factor for Type 2 diabetes, especially if you have extra weight around your waistline. Some people use continuous glucose monitors to constantly monitor their blood sugar levels. Strategists, managers, designers, and researchers who undertake the challenge of innovation, despite a lack of established procedures and a high risk of failure, will find this an invaluable resource. That's why it's so important to learn about recognizing, preventing and treating diabetes. Your doctor may also prescribe medicines to manage your symptoms. Diabetes can also damage nerves in the genitals, leading to sexual problems like erectile dysfunction. Some people use wearable insulin pumps, which can automatically give you the correct amount of insulin based on your blood sugar readings. This creates byproducts called ketones, which can change the chemical balance of your blood and make you ill. Nerve Damage Diabetic nerve damage (called neuropathy) can develop if your blood sugar levels remain too high. Choose lean meats like chicken and turkey instead of red meat. Because Type 2 diabetes is common, doctors often offer screening tests to people who are at risk of developing diabetes, including people who are overweight and between ages 35 and 70. Hypoglycemia (Low Blood Sugar) Sometimes, treatments for diabetes can make your blood sugar too low. So your doctor may recommend screening tests to find signs of kidney problems early. It can be hard to notice the symptoms, so doctors recommend that all pregnant people get screened for gestational diabetes at 24 weeks. You'll also need to monitor your blood sugar yourself throughout the day, especially before and after meals. What Complications Can Diabetes Cause? What Are the Treatments for Diabetes? Photo Courtesy: Morsa Images/Getty Images Diabetes is a health condition that develops when your body can't process sugar normally. These cause an itchy rash in sweaty areas like the groin, under the breasts or in skin folds. How Do Doctors Diagnose Diabetes? So start taking steps today to manage your diabetes and protect your overall health. Type 1 diabetes is a lifelong condition that's often diagnosed in children and teens. And the changes you make to manage your diabetes can also reduce your risk of other conditions, like heart disease and cancer. Talk with your doctor if you notice any of these signs: Waking up during the night feeling very thirstyWaking up to pee more than once per nightFalling asleep during the dayNot noticing minor injuries on your hands or feetNot being able to feel hot or cold temperatures with your fingersColor changes in your feetHaving trouble with sexual arousal Remember, there are effective treatments for diabetes. Diabetic Eye Disease Diabetic retinopathy and other diabetic eye diseases are the most common diabetes complication. Eventually, your body loses the ability to produce any insulin at all. And if you've already been diagnosed, you can take steps to manage your blood sugar. Some people with Type 2 can manage their blood sugar with lifestyle changes alone, while others need medicines as well. Without insulin, your body can't use the sugar it absorbs from the food you eat. This means following all your doctor's recommendations, checking your blood sugar regularly, planning your meals and taking your insulin or other diabetes medicines at the right times. You may also need a urine test to check for signs of diabetes or kidney problems. They peak (hit their maximum effect) at between 4 and 12 hours and continue working for up to 16 hours.Short-acting insulins work within 30 minutes. If you have diabetes, it's important to see an eye doctor for regular eye exams. You'll usually need to fast before the test, meaning you can't eat or drink anything but water for a set number of hours beforehand. There's no cure for Type 1 diabetes, but you can manage it with insulin therapy and an eating plan. There may also be a link between Type 1 diabetes and contact with certain types of bacteria and viruses in early childhood. This measures your blood glucose (sugar) levels before and after you eat or drink a certain amount of sugar. When you eat, your stomach and small intestine absorb sugar from food and release it into your bloodstream. People usually take doses of these once or twice a day so their bodies always have enough insulin available.Intermediate-acting insulins work within 2 to 4 hours. And try eating vegetable oils, nuts and seeds instead of fatty meats and dairy products. Foot Complications The combination of loss of normal sensation due to diabetic neuropathy and poor circulation in the feet means that you might not be able to feel pain signals from small injuries, blisters or ulcers. Photo Courtesy: adamkaz/E+/Getty Images It's important to remember that diabetes is very treatable, and you can live a long and healthy life with diabetes by following your treatment plan. People with uncontrolled diabetes often get fungal infections. So if you smoke, make a plan to quit.Diet — People whose diets are high in dairy products, carbohydrates and red meat have a higher risk for Type 2 diabetes than people whose eat mainly fruits, vegetables, white meat and whole grains.Other health conditions — High blood pressure, high cholesterol and heart disease can raise your risk for diabetes. This means people with diabetes have a higher risk of developing heart disease and related conditions like angina and heart attacks. Your doctor or a diabetes educator can teach you how to make sure you're getting the right amount and type of insulin at the right time. You may not notice any symptoms in the early stages, but untreated diabetic eye disease can lead to vision loss and even blindness. You may also need a physical exam, which includes checking your weight and blood pressure. Type 2 diabetes is much more common than Type 1 — more than 9 out of 10 people with diabetes have Type 2. book Business Model Generation: A Handbook for Visionaries, Game Changers, and Challengers by Alexander Osterwalder Business Model Generation is a handbook for visionaries, game changers, and challengers striving to defy outmoded ... book Value Proposition Design: How to Create Products and Services Customers Want by Trish Papadakis, Alan Smith, Gregory Bernarda, Yves Pigneur, Alexander Osterwalder The authors of the international bestseller Business Model Generation explain how to create value propositions customers ... book Design Thinking for Strategic Innovation: What They Can't Teach You at Business or Design School by Idris Mootee A comprehensive playbook for applied design thinking in business and management, complete with concepts and toolkits ... book Ten Types of Innovation: The Discipline of Building Breakthroughs by Larry Keeley, Helen Walters, Ryan Pikkal, Brian Quinn Innovation principles to bring about meaningful and sustainable growth in your organization Using a list of ... Editorial reviews Publisher Synopsis "Design thinking is a method that can be applied to nearly any endeavor, business scenario, or social reform. Aim for at least 2 and a half hours of activity a week.Eat a healthy, balanced diet with lots of fruits, veggies and whole grains.If you smoke, make a plan to quit. What Causes Diabetes? It's essential to brush your teeth twice per day and have regular dental cleanings and checkups. If you're diagnosed with prediabetes, you can make lifestyle changes to prevent it from turning into Type 2 diabetes. These changes include getting to a healthy weight, eating healthy and getting more exercise. If you have diabetes, try to cut down on saturated fats. Resource Links MORE FROM SYMPTOMFIND.COM Since it can't use sugar for energy, your body gets energy from other places, such as your fat and muscle tissue. This process is called insulin resistance. Environmental factors probably also affect your risk for Type 1 diabetes — but researchers don't yet understand exactly what role these play. In severe cases of foot infection, it may be necessary to amputate the affected foot. Get full access to 101 Design Methods and 60K+ other titles, with free 10-day trial of O'Reilly. Without treatment, kidney disease can lead to kidney failure. Your doctor can monitor your A1C level to see how well your treatment plan is working. If you're taking insulin or other medicines that lower your blood sugar levels, it's important to be aware of these symptoms and to check your blood sugar regularly. In his book, 101 Design Methods, author Vijay Kumar describes how design methods can be applied as a science, rather than through art, through practical steps of observation, reframing, ideation, prototyping, and planning." (Contract Magazine, May 2013) Read more... Unlike Type 1 diabetes, Type 2 diabetes can go into remission with effective management. Some people with Type 2 diabetes also need insulin to manage their blood sugar. But when you have diabetes, this process doesn't work correctly. Add a review and share your thoughts with other readers. Researchers have found several genes that may increase your risk of getting Type 1 diabetes. The results of this test show your average blood sugar levels over several months. People often take them at mealtimes and measure the dose according to the amount of sugar in the meal. That's why it's sometimes called "juvenile diabetes." However, people can develop Type 1 at any age. Symptoms are usually less noticeable, and people with Type 2 diabetes may not know they have it. Heart Disease High blood sugar damages your blood vessels, especially the vessels in your heart. Early symptoms of diabetes include: Frequent urination (having to pee more often than usual)Feeling very thirsty and drinking more fluids than usual As your body has more and more trouble processing sugar from the foods you eat, you may notice: IrritabilityFatigue and weaknessUnexpected weight lossFeelings of hungerNausea Complications from diabetes can lead to more severe symptoms. It may cause symptoms such as tingling or numbness. According to the American Diabetes Association, over 34 million Americans have diabetes — that's more than 1 in 10 Americans. Instead, the sugar stays in your blood. So your doctor may also recommend medicines to lower your risk of developing these conditions. Monitoring Your Blood Sugar If you've been diagnosed with diabetes, it's important to see your doctor for regular checkups. Type 2 Diabetes Where Type 1 involves a problem with your pancreas making insulin, Type 2 usually involves changes in your body's cells and how they respond to insulin. This device checks your blood sugar using a tiny drop of blood from a finger prick. Oral Health Problems People with diabetes are also prone to developing mouth infections and gum disease. Other Diabetes Medicines Medicines for Type 2 diabetes can help your body respond to insulin more effectively. Common symptoms include weight loss, weakness, thirst and frequent urination. Be the first. User-contributed reviews Add a review and share your thoughts with other readers. Over time, your pancreas produces more and more insulin, and your body's cells respond less and less. Doctors diagnose diabetes with blood tests. To get a more long-term picture of your blood sugar over time, your doctor may do a hemoglobin A1C test. They peak within an hour and continue to work for between 2 and 4 hours. You can take insulin using a pen-like device that you insert directly into your skin. You can work with your doctor to develop a healthy eating and activity plan. DKA happens when your body has too little insulin to let sugar enter your cells. Changing Your Diet What you eat plays a large role in both the prevention and control of diabetes. Photo Courtesy: Maskot/Getty Images Depending on the type of diabetes you have and how high your blood sugar is, you might not notice any symptoms at first. The first step-by-step guidebook for successful innovation planningUnlike other books on the subject, 101 Design Methods approaches the practice of creating new products, services, and customer experiences as a science, rather than an art, providing a practical set of collaborative tools and methods for planning and defining successful new offerings. How Can I Prevent Diabetes? That's why it's important to get help right away if you notice symptoms. Photo Courtesy: FatCamera/Getty Images Your doctor may also recommend a glucose tolerance test. Common diabetes medicines include the following: Biguanides, such as Metformin, help reduce the amount of glucose your liver produces. In Type 2 diabetes, your cells have trouble responding to insulin and absorbing sugar from your blood. You can treat these infections with anti-fungal cream, but it's also important to tell your doctor as soon as you notice symptoms. Novices can learn from it, managers can plan with it, and practitioners of innovation can improve the quality of their work by referring to it. Unlike the quick start of Type 1 diabetes, Type 2 diabetes happens gradually over a period of months or years. When this process works the way it's supposed to, your blood sugar stays in a healthy range. Then your body releases a hormone called insulin to make your cells take the sugar from your blood and use it for energy.
